Consider the CSS code composed by C_x, $C_z^\perp$ at length n. Define the 1-**SWAP** test on $|\psi\rangle \otimes |\phi\rangle$ to be:

1. Applay the hadamard gate on ancile.
2. Pick a random coordinate $i \sim [n]$.
3. condinatal on the ancile a swap between the ith qubit of $|\psi\rangle$ to the ith qubit of $|\phi\rangle$.
4. Applay the hadammard again on the ancile and massure. If $|0\rangle$ massured then accept, otherwise reject.

suppose for the moment that $|\psi\rangle$ and $|\phi\rangle$ are in the code. Thus:

$$
\begin{aligned}
|\psi\rangle &= \frac{1}{\sqrt{|C_z^\perp|}} \sum_{z \in C_z^\perp} |\psi + z\rangle \\
(1 - \mathbf{SWAP}) |0\rangle |\psi\rangle |\phi\rangle &= \frac{1}{|C_z^\perp|} \sum_{z,\xi \in \in C_z^\perp} (1 - \mathbf{SWAP}) |0\rangle |\psi + z\rangle |\phi + \xi\rangle \\
&= \frac{1}{\sqrt{2}|C_z^\perp|} \sum_{z,\xi \in \in C_z^\perp} H |\pm\rangle \left(|\psi + z\rangle |\phi + \xi\rangle \pm |(\phi + \xi)_i (\psi + z)_{/i}\rangle |(\psi + z)_i (\phi + \xi)_{/i}\rangle \right) \\
\Rightarrow \mathbf{Pr}[|0\rangle] &= \frac{1}{4|C_z^\perp|^4} (\\
&\quad 2|C_z^\perp|^4 + 2 \sum_{z',\xi',z,\xi \in \in C_z^\perp} \\
&\quad \overbrace{\left(\langle \psi + z'| \langle \phi + \xi'| |(\phi + \xi)_i (\psi + z)_{/i}\rangle |(\psi + z)_i (\phi + \xi)_{/i}\rangle \right)}^{A} + \\
&\quad \overbrace{\left(\langle (\phi + \xi')_i (\psi + z')_{/i}| \langle (\psi + z')_i (\phi + \xi')_{/i}| |(\phi + \xi)_i (\psi + z)_{/i}\rangle |(\psi + z)_i (\phi + \xi)_{/i}\rangle \right)}^{B} \\
&\quad)
\end{aligned}
$$

$$
\begin{aligned}
A &= \langle \psi + z'| |(\phi + \xi)_i (\psi + z)_{/i}\rangle \langle \phi + \xi'| |(\psi + z)_i (\phi + \xi)_{/i}\rangle \\
&= \begin{cases} 0 & z' \neq z \text{ Assume that } d(C_z^\perp) > 1 \\ 1 & z' = z, \text{ and } (\psi + z)_i = (\phi + \xi)_i \end{cases}
\end{aligned}
$$

And the equalitiy $(\psi + z)_i = (\phi + \xi)_i$ holds if ethir both ψ, ϕ agree and z, ξ agree on i or both pair disagree.
