Consider the CSS code composed by C_x, $C_z^\perp$ at length n. Define the 1-**SWAP** test on $|\psi\rangle \otimes |\phi\rangle$ to be:

1. Applay the hadamard gate on ancile.
2. Pick a random coordinate $i \sim [n]$.
3. condinatal on the ancile a swap between the ith qubit of $|\psi\rangle$ to the ith qubit of $|\phi\rangle$.
4. Applay the hadammard again on the ancile and massure. If $|0\rangle$ massured then accept, otherwise reject.

suppose for the moment that $|\psi\rangle$ and $|\phi\rangle$ are in the code. Thus:

$$\begin{aligned}
|\psi\rangle &= \frac{1}{\sqrt{|C_z^\perp|}} \sum_{z \in C_z^\perp} |\psi + z\rangle \\
(1 - \mathbf{SWAP}) |0\rangle |\psi\rangle |\phi\rangle &= \sum_{z,\xi \in \in C_z^\perp} (1 - \mathbf{SWAP}) |0\rangle |\psi + z\rangle |\phi + \xi\rangle \\
&= \sum_{z,\xi \in \in C_z^\perp} H |\pm\rangle \left(|\psi + z\rangle |\phi + \xi\rangle \pm |(\phi + \xi)_i (\psi + z)_{/i}\rangle |(\psi + z)_i (\phi + \xi)_{/i}\rangle \right) \\
\Rightarrow \mathbf{Pr}[|0\rangle] &= \sum_{z,\xi \in \in C_z^\perp} A
\end{aligned}$$
