

Magic States Distillation Using Δ -Toric (good qLDPC?).

David Ponnarovsky

January 4, 2024

Claim 0.1. *Let C be a code at rate $\rho(C) > 7/8$ has at least one codeword $x \in C$, such that $|x| =_8 1$.*

Definition 0.1. *We will say that a code C is (l, m) -genorthogonal if there exists a generator set G for C such that for any $I \subset G$ such that $1 < |I| < l$ we have that:*

$$\sum_{i \in [n]} \prod_{g_j \in I \subset G} g_j^i =_m 0$$

Claim 0.2. *If there exists a single (l, m) -genorthogonal code for a finite length Δ , then there is a family of (l, m) -genorthogonal good codes. Moreover, if there exists a generator in C_0 of weight $|\cdot|_m = 1$, then there exists a family that also has at least one generator of weight $|\cdot|_m = 1$.*

Proof. Denote by $C_0 = \Delta[1, \rho_0, \delta_0]$ an (l, m) -genorthogonal code and observes that for any $C = [n, \rho n, \delta n]$ the tensor code $C_0 \otimes C = [\Delta n, \rho_0 \rho \Delta n, \delta_0 \delta \Delta n]$ is also (l, m) -genorthogonal code.

For the second part of the claim, Choose C to be a good code with rate $> (2^m - 1)/2^m$ by Claim 0.1 there is at least one codeword c in C such that $|c|_m = 1$.

So pick the base for $C_0 \otimes C$ such the first generator is $g_0 \otimes c$ where g_0 denote a generator of C_0 satisfies $|g_0|_m = 1$. Then $|g_0 \otimes c|_m = |g_0|_m \cdot |c|_m =_m 1$. \square

Claim 0.3. *Suppose that there exists $(m+1, m)$ -genorthogonal code, such that any generator of it has weight $|\cdot|_m = 1$ then there exists also a family of good $(m+1, m)$ -genorthogonal codes such that a linear portion of its generators g have weight $|g|_m = 1$.*

Proof. Denote by C_0 a finite $(m+1, m)$ -genorthogonal code, such that any generator of it has weight $|\cdot|_m = 1$. Let C be a good $(m+1, m)$ -genorthogonal code with generator c such that $|c|_m = 1$, the existence of which is given by Claim 0.2. Denote its rate by ρ . If C has more than $\rho/m \cdot n$ generators at weight $|\cdot|_m = 1$ then we are done. Otherwise, by the pigeonhole principle, there is an i such that more than ρ/m portion of the generators are at weight $|\cdot|_m = i$. Denote them by $g_1, g_2, g_3, \dots, g_m$.

Define the set g'_1, g'_2, \dots, g'_m as

$$\begin{aligned} g'_t &= c + \sum_{j=t}^{t+m} g_j \\ \Rightarrow |g'_{t+1}| &= |c| + \sum_t |g_j| + \sum_{|I| < l+1} \left| \prod_{g \in I} \alpha_{\star} g \right| \\ &=_m c + m \cdot i =_m c =_m 1 \end{aligned}$$

Now take $C_0 \otimes C$, and set the new generator set to be $g_i^0 \otimes g'_j$. And it's easy to verify that we got the code we wanted. \square

Claim 0.4. *There exists, a good LDPC code (classic) C such that C^\perp is also a good code and a generator set G , for exists $G' \subset G$ and $|G'| = \Theta(|G|)$ such:*

1. For any pair $x \neq y \in G' \rightarrow x \cdot y =_8 0$
2. For any triple $x \neq y, z \in G' \rightarrow \sum_i x_i y_i z_i =_8 0$
3. For any $x \in G' \rightarrow |x| =_8 1$

Claim 0.5. *There is $n \rightarrow \Theta(n)$ magic states distillation into a binary qldpc code with $\Theta(\sqrt{n})$ distance, and therefore with asymptotic overhead approaching 1*

Proof. For the encoding we are going to use the hyperproduct code defined in [TZ14]. Let C be the code given by Claim 0.4 and consider the hyperproduct of C with itself $Q = Q(C \times_H C)$. In addition, denote by C_X, C_Z the CSS representation of Q .

By the fact that C^\perp is also a good code, then Q is a positive rate, square root distance code. Let ρ be the rate of C and $1 - \rho$ be the rate of C^\perp . As $\rho > 0$, then one can find $I \subset [n]$ coordinates such that for any $i \in I$ the indicator $e_i \notin C^\perp$. Hence, it holds from [TZ14] that any vector of the form $e_i \otimes x$ is a codeword of C_X/C_Z^\perp .

Denote by ρ' the portion of G' as defined in Claim 0.4, and define S to be:

$$S = \{e_i \otimes x | e_i \notin C^\perp, x \in G'\}$$

Observe that $|S| = \rho' \rho n^2$ and in addition S satisfies the properties in Claim 0.4. Denote by f a codeword supported only on S and denote by X_s the indicator that indicates that s supports f . Thus:

$$\begin{aligned} T^{\otimes n} |f\rangle &= \exp \left(i\pi/4 \sum_g X_g \overbrace{|g|}^{8k+1} \right. \\ &\quad \left. - 2 \cdot i\pi/4 \sum_{g,h} \overbrace{X_g X_h |g \cdot h|}^{8k} \right. \\ &\quad \left. + 4 \cdot i\pi/4 \sum_{g,h} \overbrace{X_g X_h X_l |g \cdot h \cdot l|}^{8k} \right) |f\rangle \\ &= \exp \left(i\pi/4 \sum_{g \in S} X_g \right) |f\rangle \end{aligned}$$

Therefore we can, generate the encoded ([\[COMMENT\]](#) For now without spanning on C_Z^\perp) product of $T^{\otimes |S|} |+\rangle^{|S|}$:

$$\prod_{s \in S} \left(|0\rangle + \exp(i\pi/4) |s\rangle \right)$$

[\[COMMENT\]](#) What is left:

1. Show that one can generate $\prod_{s \in S} \left(|C_Z^\perp\rangle + \exp(i\pi/4) |C_Z^\perp + s\rangle \right)$ without propagate the errors.
I think I know how to do it.
2. Compute a threshold p_0 for using Baravi construction.

Thus we have that $\gamma = \log(n/k)/\log(d) = \log(n/|S|)/\log(\Theta(\sqrt{n})) \rightarrow 0$ and the overhead grows as $\log^\gamma(n) \rightarrow 1$. \square
