Consider the CSS code composed by C_x, $C_z^{\perp}$ at length n. Define the 1-**SWAP** test on $|\psi\rangle \otimes |\phi\rangle$ to be:

1. Applay the hadamard gate on ancile.
2. Pick a random coordinate $i \sim [n]$.
3. condinatal on the ancile a swap between the ith qubit of $|\psi\rangle$ to the ith qubit of $|\phi\rangle$.
4. Applay the hadammard again on the ancile and massure. If $|0\rangle$ massured then accept, otherwise reject.

suppose for the moment that $|\psi\rangle$ and $|\phi\rangle$ are in the code. Thus:

$$
\begin{aligned}
|\psi\rangle &= \frac{1}{\sqrt{|C_z^{\perp}|}} \sum_{z \in C_z^{\perp}} |\psi + z\rangle \\
(1 - \mathbf{SWAP}) |0\rangle |\psi\rangle |\phi\rangle &= \frac{1}{|C_z^{\perp}|} \sum_{z,\xi \in \in C_z^{\perp}} (1 - \mathbf{SWAP}) |0\rangle |\psi + z\rangle |\phi + \xi\rangle \\
&= \frac{1}{\sqrt{2}|C_z^{\perp}|} \sum_{z,\xi \in \in C_z^{\perp}} H |\pm\rangle \left(|\psi + z\rangle |\phi + \xi\rangle \pm |(\phi+\xi)_i (\psi+z)_{/i}\rangle |(\psi+z)_i (\phi+\xi)_{/i}\rangle \right) \\
\Rightarrow \mathbf{Pr}[|0\rangle] &= \frac{1}{4|C_z^{\perp}|^4} (\\
& 2|C_z^{\perp}|^4 + 2 \sum_{z',\xi',z,\xi \in \in C_z^{\perp}} \\
& \overbrace{\left(\langle \psi + z'| \langle \phi + \xi'| |(\phi+\xi)_i (\psi+z)_{/i}\rangle |(\psi+z)_i (\phi+\xi)_{/i}\rangle \right)}^{A} + \\
& \overbrace{\left(\langle (\phi+\xi')_i (\psi+z')_{/i}| \langle (\psi+z')_i (\phi+\xi')_{/i}| |(\phi+\xi)_i (\psi+z)_{/i}\rangle |(\psi+z)_i (\phi+\xi)_{/i}\rangle \right)}^{B} \\
&)
\end{aligned}
$$

$$
A = \langle \psi + z'| |(\phi+\xi)_i (\psi+z)_{/i}\rangle \langle \phi + \xi'| |(\psi+z)_i (\phi+\xi)_{/i}\rangle
$$
